# Business Intelligence and Big Data in Cyber-Secure Environments

Thesis of the Master's degree in  
Business Intelligence and Big Data in  
Cyber-Secure Environments

título del TFM

Presented by Adrián Riesco Valbuena  
in University of Burgos — February 28, 2022  
Tutor: Alvar Arnáiz González

# Universities of Burgos, León and Valladolid

## Master's degree in Business Intelligence and Big Data in Cyber-Secure Environments

Mr. Alvar Arnáiz González, professor of the department named Computer Engineering, area named Computer Languages and Systems.

Exposes:

That the student Mr. Adrián Riesco Valbuena, with DNI 71462231N, has completed the Thesis of the Master in Business Intelligence and Big Data in Cyber-Secure Environments titled NOMBRE TFM.

And that thesis has been carried out by the student under the direction of the undersigned, by virtue of which its presentation and defense is authorized.

In Burgos, February 28, 2022

Approval of the Tutor:

Mr. Alvar Arnáiz González

## Resumen

En este primer apartado se hace una **breve** presentación del tema que se aborda en el proyecto.

## Descriptores

Palabras separadas por comas que identifiquen el contenido del proyecto Ej: servidor web, buscador de vuelos, android ...

## **Abstract**

A **brief** presentation of the topic addressed in the project.

## **Keywords**

keywords separated by commas.

# Introduction

---

Social networks are currently a fundamental aspect of society. People usually use social networks to share experiences, opinions and aspects of their lives and interact with other people. Using social networks as a data source we can access a huge amount of information and be able to build accurate analyzes on practically any topic.

On the other hand, another aspect that has gradually permeated our society is the concept of subscriptions to services, be it music, movies, games or almost any concept that we can think of. Not so many years ago, the concept of paying for subscriptions to services, where you don't actually own the content you pay for and instead get temporary access whose duration is defined by how long you continue to pay for the subscription, was relegated to very specific services and was not nearly as globalized as it is today.

The global acceptance of subscription as a service is reflected in social networks, where users can comment on the different music, movie and game platforms, each new development becoming a social phenomenon. With the aim of making use of both worlds, in this project the social network Twitter will be used to obtain information on the latest music listened to by users (by searching for a certain hashtag) and subsequently consult the data of the song and the artist involved that Spotify, a platform based on music as a service, has. The development of the project has followed an agile methodology with two-week sprints.

---

## Project objectives

---

The initial objectives through which the use case was built consisted in the following points:

- Ability to obtain data in real time.
- Combine at least two different data sources.
- Potential to scale in both technology and data volume.
- Involve various technologies from the world of Big Data.
- Mostly open source tools.

After a research, the author designed the use case and built the objectives of the projects:

- Build a pipeline to gather information about last songs listened from the Twitter API.
- Find information about the songs (name, artist, audio features) through the Spotify API.
- Store all the data in a data warehouse under a technology.
- Build a pipeline to gather information about last songs listened from the Twitter API.

Through these global objectives, the low-level functional and technical requirements were specified. More information about these requirements is included in the annex.

---

# Theoretical concepts

---

In this section are covered the theoretical concepts in which the project has been based. All concepts are described in a detailed and simple way since this master's degree can be aimed at technical and non-technical students.

## 3.1 API

Section explaining API concepts.

### Twitter API

Section explaining Twitter. Section explaining Twitter API.

### Spotify API

Section explaining Spotify. Section explaining Spotify API.

## 3.2 Orchestrator

Section explaining Flow Orchestrator -> Airflow.

## 3.3 NoSQL Databases

Section explaining NoSQL Databases.

| Tools                 | App | AngularJS | API REST | BD | Memoria |
|-----------------------|-----|-----------|----------|----|---------|
| HTML5                 |     | X         |          |    |         |
| CSS3                  |     | X         |          |    |         |
| BOOTSTRAP             |     | X         |          |    |         |
| T <sub>E</sub> XMaker |     |           |          |    | X       |
| Astah                 |     |           |          |    | X       |

---

## Techniques and tools

---

In this section are presented the methodological techniques and development tools used to carry out the project.

### 4.1 GitHub

GitHub is the repository where the project was uploaded and its evolution was tracked.

### 4.2 APIs

During this project there were used APIs from two different providers to gather the information: Twitter API and Spotify API.

### 4.3 Postman

Postman is a tool that allows the user to send HTTPS request in a simple way.

### 4.4 Apache Airflow

Apache Airflow is a flow orchestrator that allows the user to...

### 4.5 Apache Spark

Apache Spark is...

## **4.6 Cassandra**

Cassandra is a NoSQL database that...

## **4.7 Flask**

Flask is...

## **4.8 Bootstrap**

Bootstrap is...

## **4.9 Docker**

Docker is...

## **4.10 Docker Compose**

Docker Compose is...

---

## Relevant aspects of the project

---

The first step of the project was the feasibility and viability analysis of the concept devised. The author was looking to use two data sources with:

- Real and updated data, preferable related to the social interest.
- The possibility of getting a stream data flow.
- The potential to combine both to get an added value.

Considering the previous points, the author found an interesting option on Twitter and Spotify providers. Both of them provides solid APIs for a fluid development and have the characteristics needed to combine the data collected. Consequently, the author designed the following use case:

1. The Twitter API is consulted to gather the *tweets* with the hashtag *#NowPlaying*.
2. The tweet is cleaned, removing the stopwords and the other hashtags and getting the song name and artist as isolated as possible.
3. The Spotify API is consulted to gather the information of the song identified.
4. The vector values of the cleaned Twitter data and the name of the song returned by Spotify are compared to ensure they are the same.
5. The data is moved to the database, ready to be stored and visualized.

During the design phase, the author analyzed the output of both APIs using Postman.

The project development was undertaken following an Agile methodology.

---

## Related works

---

This section would be similar to a state of the art of a thesis or dissertation. In a final master's thesis, its presence does not seem so obligatory, although it can be left to the tutor's judgment to include a small commented summary of the works and projects already carried out in the field of the current project.

---

## Conclusions and future work lines

---

Every project must include the conclusions derived from its development. These can be of a different nature, depending on the type of project, but normally there will be a set of conclusions related to the results of the project and a set of technical conclusions. In addition, it is very useful to make a critical report indicating how the project can be improved, or how work can continue along the lines of the completed project.

# Appendix

## Appendix A

---

# Project Plan

---

### A.1 Introduction

The project planning was decided in an initial meeting between the author and its tutor. It was based in an Agile methodology, with two-weeks *sprints* and meetings between the author and his tutor conditioned to their availability.

The project repository was stored in GitHub under the url <https://github.com/AdrianRiesco/Data-Engineer-project>. Each *sprint* was created as an *milestone*, with the *issues* contained there being the tasks assigned. The *issues* were created to reflect tasks at most eight hours, allowing the author segregate his work and manage each *sprint* better. The author closed an *issue* when the task was finished and a *milestone* when the *sprint* was over, regardless of its state. If a task remained in an open state when a *sprint* reached its planned end date, the *issue* was transfered to the next *milestone*.

A meeting was held by the author and his tutor at the end of each sprint. During these meetings, both of them reviewed the state and development of the tasks of the corresponding sprint and planned the tasks of the next sprint. All the *milestones* and *issues* can be consulted in the project repository.

## A.2 Temporary planning

The sprints carried out for the development of the project are described below with they correspondant dates:

**Initial meeting.** Held on Monday January 31st, it was the start point for the first sprint. During this meeting, the objective of the project, the data source and the tools to be used were validated by both the author and his tutor. The author previously made a research and came with an idea and the tutor exposed his point of view to create the final goal.

**Sprint 1.** Weeks of January 31st and February 7th. This Sprint had the following tasks assigned:

- Configure the work environment.
- Configure the project memory template.
- Write a draft of the objectives and main goals.
- Write a brief description of the tools selected.
- Write a brief explanation of the selected tools and the work methodology.
- Inspect Twitter API.
- Inspect Spotify API.

The end-of-sprint meeting was held on Wednesday February 16th. Analysis: Most of the activities were realized by the author, excepting the Inspection of the Spotify API. Regarding the Twitter API, the author inspected the output and he concluded that it had the characteristics needed to be used to launch queries to the Spotify API (the tweet could be cleaned to get the song name and artist).

**Sprint 2.** Weeks of February 14th and February 21st. This Sprint had the following tasks assigned:

- Write the code to gather information from Spotify.
- Write the code to gather information from Twitter.
- Configure the Spark environment.
- Write a description of Spotify and Twitter APIs.
- Write the API inspection process in the "Programmer guide" section.

- Write the project introduction.
- Write the Twitter and Spotify data description.

The end-of-sprint meeting was held on M— February –th. Analysis:

**Sprint 3** . Weeks of February 28th and March 7th. This Sprint had the following tasks assigned:

- Task1.

The end-of-sprint meeting was held on M— March –th.

**Sprint 4** . Weeks of March 14th and March 21st. This Sprint had the following tasks assigned:

- Task1.

The end-of-sprint meeting was held on M— March –th.

**Sprint 5** . Weeks of March 28th and April 4th. This Sprint had the following tasks assigned:

- Task1.

The end-of-sprint meeting was held on M— April –th.

**Sprint 6** . Weeks of April 11th and April 18th. This Sprint had the following tasks assigned:

- Task1.

The end-of-sprint meeting was held on M— April –th.

**Sprint 7** . Weeks of April 25th and May 2nd. This Sprint had the following tasks assigned:

- Task1.

The end-of-sprint meeting was held on M— May –th.

**Sprint 8** . Weeks of May 9th and May 16th. This Sprint had the following tasks assigned:

- Task1.

The end-of-sprint meeting was held on M— May –th.

**Sprint 9** . Weeks of May 23rd and May 30th. This Sprint had the following tasks assigned:

- Task1.

The end-of-sprint meeting was held on M— June –th.

**Sprint 10** . Weeks of June 6th and May 13th. This Sprint had the following tasks assigned:

- Task1.

The end-of-sprint meeting was held on M— June –th.

### **A.3 Feasibility study**

The architecture of the project and the use case were designed to ensure its feasibility.

#### **Economic feasibility**

The project is based on open-source platforms to ensure its economic and legal feasibility. The APIs where the information was gathered are free to use if the developer keeps his queries under specific limit rates.

#### **Legal feasibility**

The project is based on open-source platforms to ensure its economic and legal feasibility.

## *Appendix B*

---

# Requirements

---

### **B.1 Introduction**

### **B.2 General objectives**

The requirements through which the use case was built were the following:

- Ability to obtain data in real time.
- Combine at least two different data sources.
- Potential to scale in both technology and data volume.
- Involve various technologies from the world of Big Data.
- Mostly open source tools.

### **B.3 Catalog of requirements**

The functional requirements that the project had to meet were:

**F1** The data must be obtained from the Twitter hashtag #NowPlaying every 15 minutes, taking care of API rate limits.

**F2** The visualizations must show last songs name, artist and audio features.

**F3** The visualization must have a link to the source tweet.

**F4** -

The technical requirements that the project had to meet were:

- T1** Ability to be deployed in different environments with minimum effort.
- T2** Automated data flow, with whole process orchestrated by a unique tool.
- T3** Data warehouse with ability to escalate in terms of a Big Data problem.
- T4** -

### D.1 Introduction

### D.2 Directory structure

Estructura GitHub.

### D.3 Programmer's guide

#### Analysis

During the analysis phase, the author inspected the output of Twitter and Spotify APIs using Postman. In the first place, relying on the Twitter documentation, the author inspected the Twitter API by following the next steps:

1. Get access to the Twitter Developer Portal.
2. Get the credentials needed to consult the different endpoints of the API.
3. Import the *Twitter API v2* collection on Postman.
4. Create a fork of the automatically created environment (*Twitter API v2*) and collection *Twitter API v2* to be able to edit the values.

5. Modify the environment to include the following developer keys and tokens:
  - Consumer key (consumer\_key).
  - Consumer secret (consumer\_secret).
  - Access token (access\_token).
  - Token secret (token\_secret).
  - Bearer token (bearer\_token).
6. In the collection tab, select the endpoint *Search Tweets -> Recent search* for the initial exploration. Configure the following parameters:
  - query = #NowPlaying
  - tweet.fields = created\_at,entities
  - max\_results = 10
7. Now, we can send our query [https://api.twitter.com/2/tweets/search/recent?query=%23NowPlaying&max\\_results=10&tweet.fields=created\\_at,entities](https://api.twitter.com/2/tweets/search/recent?query=%23NowPlaying&max_results=10&tweet.fields=created_at,entities) to get the 10 most recent tweets with the hashtag #NowPlaying and receive their basic information (id, text) as well as the entities (hashtags, urls, annotations...) and the creation time stamp.

After analyze the data gathered from the Twitter API, the author inspected the Spotify API, more specifically the endpoint "Search for Item"), following the next steps:

1. Get access to the Spotify Developer Portal.
2. Enter in the developers console and select the "Search for Item" endpoint.
3. Specify the parameters of the search. We can specify the type "track" and add a limit of 1 to only receive the first song found.
4. After click on get the bearer token, we can use that token by clicking on Try Me or just copy the resulting query in our Linux console to check the output.
5. The result of this query is the first result of the search containing information of the artist, the song and the album. With the artist and song ids we can consult other endpoints to get an audio analysis, the audio features and the artist information, between others.

## Development

During the development phase, the following items were installed in the system:

- Docker version 20.10.12, build e91ed57.
- docker-compose version 1.29.2, build 5becea4c.
- docker-compose version 1.29.2, build 5becea4c.

Steps followed:

1. Create the dockerfile.
2. Build the image: *docker build -f spark.Dockerfile -t ar/spark-ubuntu .*
3. Create a Docker network: *textitdocker network create --driver bridge spark-network*
4. Run the image: *sudo docker run -d -t --name master --network spark-network ar/spark-ubuntu*
